## 1 Prelude

;; Copyright (c) 2016 Brian Beckman

“Storeys” is a pun on “story” and the levels of a dungeon. We avoid the word “level” because it’s ambiguous between the level of advancement of a character and the level or storey of the dungeon.

## 2 Project Structure

### 2.1 Brute-Force Loads

The current system structure is just a sequence of load commands. Dependencies of one facility on another is expressed only implicitly by the sequence of those loads, and only in top-level, runnable lisp files. For example, *box* depends on *point*, but *box.lisp* doesn’t load *point.lisp*. Instead, any file that wants to use *box* must load *point.lisp* before loading *box.lisp*. *box.lisp* *could* load *point.lisp*, but then *point.lisp* would be loaded more than once. Harmless but inefficient. If *box.lisp* doesn’t load *point.lisp*, then *box.lisp* can’t stand alone. That’s the decision we made:

*Facilities are not typically standalone, and their dependencies are implicit in the sequence of load commands.*

Currently, there are two contexts in which this brute-force loading goes on:

1. any main code, such as *charms-test-5.lisp*
2. quickcheck code, like *test.lisp*

For example, in one intermediate version, *charms-test-5.lisp* loaded files in this order:

```
(load "point.lisp")
(load "box.lisp")
(load "glyph.lisp")
(load "world.lisp")
(load "storey.lisp")
(load "room.lisp")
(load "rendering.lisp")
```

The convention for quickcheck code is a little more subtle: it will load unit-test files out of the *test* directory in the same order as a main file does. For instance, the version of *test.lisp* corresponding to the version of *charms-test-5.lisp* noted above looks like this:

```
(load "~/quicklisp/setup.lisp")
```

```

(ql:quickload :cl-quickcheck)
(ql:quickload :defenum)
(ql:quickload :alexandria)
(ql:quickload :hash-set)

(let ((*random-state* (make-random-state t))
      (*print-length* 6)
      (*load-verbose* t))

  (shadow 'cl-quickcheck:report '#:cl-user)
  (shadow 'defenum:enum         '#:cl-user)
  (use-package :cl-quickcheck)
  (use-package :defenum))

;; This sequence of 'load' expressions should parallel the 'load's at the head
;; of any main like 'charms-test-5.lisp'.

(load "test/point.lisp")
(load "test/box.lisp")
(load "test/glyph.lisp")
(load "test/geo.lisp")
(load "test/world.lisp")
(load "test/storey.lisp")
(load "test/room.lisp")
(load "test/rendering.lisp")
)

```

No doubt, you've deduced that main codes and test codes — anything that runs facility code — must also load *quickload* and any quickload dependencies like *alexandria*. Just as with our own facilities, you must do this by brute force.

Each file in the test directory must load its brother from the top-level directory. For example, `test/glyph.lisp` looks like this:

```

(load "glyph.lisp")

(quickcheck
  (is= 42 42))

```

Because we run `test.lisp` from the top level, `test/glyph.lisp` will load the top-level `glyph.lisp`. Of course, `test/glyph.lisp` must load any of its dependencies. It doesn't have any in the version we're talking about, so everything is fine. But `test/box.lisp` needs top-level `point.lisp`. So `test/box.lisp` looks like this:

```

(load "point.lisp")
(load "box.lisp")

;;; blah blah blah

```

```
(quickcheck
  (is= 42 42))
```

All this is cumbersome and brittle, so we will fix it with something like ASDF later.

## 2.2 TODO ASDF

# 3 Basics

## 3.1 Point

## 3.2 Box

## 3.3 Glyph

# 4 Storeys

## 4.1 World

The world has a sequence of *storeys*. There is a first one, but not a last one.

```
(defclass world ()
  ((storeys :accessor world-storeys :initform () :initarg :storeys)))
```

## 4.2 Storey

A storey has a matrix of *tiles*. It's likely that we will change the representation of a story to a sparse matrix in the future, so abstracting its representation is worthwhile prophylaxis (future-proofing).

The coordinate system of any storey has origin (0,0) so that array indices and tile coordinates are always identical.

```
(defconstant +storey-width+ 256)
(defconstant +storey-height+ 256)

(defun make-storey (&key (width +storey-width+)
                  (height +storey-height+))
  (make-array `(:height ,height :width ,width)
    :initial-element nil))

(let ((m (make-storey :width 10 :height 6)))
  (setf (aref m 2 1) :hi)
  m)
```

### 4.3 Tile

Each tile contains exactly one (possible nil) *geo*, zero or one *critters*, and a bag of *treasures*. We allow nil geos because most tiles will have nothing interesting in them. A nil tile means the same as a nil geo in a non-nil tile.

```
(defclass tile ()
  ((geo      :accessor tile-geo      :initform nil :initarg :geo)
   (critter   :accessor tile-critter   :initform nil :initarg :critter)
   (treasures :accessor tile-treasures :initform nil :initarg :treasures)
   (lighted   :accessor tile-lighted   :initform nil :initarg :lighted)
  ))

(let ((m (make-storey :width 10 :height 6)))
  (setf (aref m 2 1)
        (make-instance 'tile))
  m)
```

### 4.4 Room

A *room* is a rectangular region of tiles in a storey. It has a reference to its storey and a reference to a box specifying the top and left coordinates of the room with respect to the storey's origin (0,0), and a width and height.

### 4.5 Geo

A geo could be nil, meaning “nothing interesting here,” or a wall, door, rock, or trap.

```
(defclass geo ()
  ((kind :accessor geo-kind :initform nil :initarg :kind)))
```

#### 4.5.1 Wall

1. Inscribed

#### 4.5.2 Door

1. Open
2. Closed
3. Locked
4. Spiked
5. Broken

#### **4.5.3 Rock**

1. Granite
2. Quartz
3. Magma
4. Lava

#### **4.5.4 Trap**

1. Gas
  - (a) Poison
  - (b) Drug
  - (c) Blindness
  - (d) Fear
2. DimMak
3. Dart
  - (a) Poison
  - (b) Drug
4. Fire
5. Boulder
6. Flood
7. Curse
8. Ice
9. Immobilization
10. Lightning
11. Pit
12. Hole
13. Teleport

## **4.6 Critter**

### **4.6.1 Me**

### **4.6.2 Monster**

## **4.7 Treasure**

### **4.7.1 Potion**

### **4.7.2 Scroll**

### **4.7.3 Armor**

### **4.7.4 Weapon**

## **5 Rendering**

### **5.1 Screen**

### **5.2 Window**

### **5.3 Scroll-state**

## **6 Me**

### **6.1 Attributes**

#### **6.1.1 Dynamic**

1. HitPoints
2. Mana
3. Energy
4. Rage
5. Focus

#### **6.1.2 Static**

1. Strength
2. Wisdom
3. Constitution
4. Stamina
5. Intellect
6. Charisma

7. Agility
8. Dexterity
9. Versatility
10. Mastery

## **6.2 Classes**

## **6.3 Races**

# **7 Treasures**

## **7.1 Armor**

### **7.1.1 Head**

### **7.1.2 Shoulders**

### **7.1.3 Chest**

### **7.1.4 Arms**

### **7.1.5 Wrists**

### **7.1.6 Hands**

### **7.1.7 Pants**

### **7.1.8 Feet**

### **7.1.9 Neck**

### **7.1.10 Trinkets**

### **7.1.11 Rings**

## **7.2 Weapons**

### **7.2.1 One-Handers**

1. Swords
2. Daggers
3. Maces
4. Clubs
5. Fists

### **7.2.2 Two-Handers**

1. Staves
2. Swords
3. Maces
4. Clubs

### **7.2.3 Ranged**

1. Guns
2. Bows
3. Crossbows

## **7.3**

# **8 Players**

## **8.1 AI**

## **8.2 Bots**

Emacs 24.5.1 (Org mode 8.2.10)
